THE PERFORMANCE GAP PROJECT

Closing the Gap Between Design & As Built

Rob Pannell
Managing Director
Zero Carbon Hub

25th November 2015
## PURPOSE AND STRATEGIC OBJECTIVES

*Facilitate the mainstream delivery of low and zero carbon homes working across boarders*

- Provide leadership and create confidence
- Reduce risk
- Disseminate information

<table>

Further Research
Interim Report

The Problems!
CROSS-CUTTING THEMES

- KNOWLEDGE & SKILLS
- RESPONSIBILITY
- COMMUNICATION
Literature Review

- State of the industry (*aggregated data*)
  - NHBC, LABC, SAP software providers, professional institutions, house builders, manufacturers

- Compliance processes
  - As-built SAPs, ACD/ECD use, Air pressure tests, commissioning

- Field trials
  - TSB Building Performance Evaluation, EST Heat pump trials

- Academic studies
  - Stamford Brook, Elmtree Mews, Temple Avenue

- “Secret” knowledge
  - Manufacturers, Universities
Housebuilding Process Review

- 21 sites analysed
- Over 200 units
- Completely anonymous
- Identified many issues
Evidence Review

The truth behind the myths.
Prioritisation of issues

- 15 Priority for Action

AND cross-cutting themes

- KNOWLEDGE & SKILLS
- RESPONSIBILITY
- COMMUNICATION

Evidence Review Report
CONCEPT DESIGN & PLANNING

P2
Limited understanding of impact of early design decisions on energy performance

DETAILED DESIGN

D1
Inadequate understanding and knowledge within detailed design team

D2
Lack of integrated design between fabric, services & renewables

EM8
Issues around use of U-value and thermal bridging calculation procedures

EM7
Concern over competency of SAP assessors

PROCUREMENT

PR2
Inadequate consideration of skills and competency at labour procurement

CONSTRUCTION & COMMISSIONING

C5
Product substitution on site without consideration of energy performance

C15
Poor installation of fabric

C9
Poor installation or commissioning of services

C13
Lack of site team energy performance knowledge & skills

C6
Lack of adequate energy performance related QA on site

VERIFICATION & TESTING

T3
Concern over consistency of some test methodologies & interpretation of data

EM4
As-Built SAP not reflective of actual build

V2
Lack of robust energy performance related verification, reliance on third party information

V5
Lack of clarity over documentary evidence for Part L & Part F compliance
Inadequate Understanding & Knowledge within Design Team

Impact on:
- Buildability
-Compatibility of systems, materials and services
- Thermal detailing

Typical examples:
- Details into which insulation is impossible to fit
- No detail on support of screed at ground floor perimeters
- No consideration of thermal bridges for rooms over garages
- Etc....
Reality:
- Wall ties ✓
- Compressed edge seal ❌
- Insulation ❌
2. Concern over Competency of SAP Assessors

Problems with:

- Accuracy of inputs
- Following conventions
- Validating assumptions
- Evidencing assessments

Massive impact where they are giving design advice
How is the u-value calculated?

Can’t assume same thickness across entire roof

Reduced space above joists makes installation of full insulation thickness impossible despite this being assumed in SAP calculation

500mm roof insulation specification on 18° roof pitch
Lack of Site Team Energy Performance Related Knowledge and Skills and/or Care

Literature Review -

- “The lack of proper training of the workforce......resulted in significant construction faults, unplanned design solutions and wrong system commissioning”

  Oxford Brookes University, *Understanding the Gap between As Designed and As Built Performance*, 2013
Windows located in front of design positions

- Insufficient overlap with cavity closer
- **All** sites visited had the window in the wrong place
4. Product Substitution On Site

Literature Review -

- “The most striking observation about the application of materials and components were the number of occasions on which materials intended for one location were used in another”

Leeds Metropolitan University, Lessons from Stamford Brook, 2008
INDUSTRY RECOMMENDATIONS
INDUSTRY RECOMMENDATIONS

- Performance Assessment R&D
- Skills and Knowledge Development
- Construction Details Scheme
- Continued Evidence Gathering
GOVERNMENT RECOMMENDATIONS
GOVERNMENT RECOMMENDATIONS

Signal Clear Direction
Stimulate Industry Investment
Strengthen Compliance Regime
Support Skills & Knowledge Development
ROUTE MAP TO 2020

The challenge ahead
How to address the Performance Gap?

- Provide a good practice guide in simple, clear format

- Use with on site toolbox talks, site manager training, builder’s merchants, building control, designer awareness, specifications, warranty providers.....disseminate lessons to the industry!
Site posters

ZERO CARBON HUB BUILDERS' BOOK

CAVITY WALL

**PROBLEM TO AVOID**

**GAPS IN INSULATION**

- GAPS!
- AIR GAP
- GAPS BETWEEN ADJACENT BOARDS - HEAT LOSS

**WHAT TO DO?**

1. Protect cavity and insulation from mortar droppings
2. Smooth mortar joints to allow insulation board tight against block
3. Install insulation tightly batted with no gaps
4. Cut insulation tight to cavity closures, bricks and cavity trays

**GOOD PRACTICE**

Please print and use in your site office, for further information: www.zerocarbonhub.org

---

ZERO CARBON HUB BUILDERS' BOOK

CAVITY WALL

**PROBLEM TO AVOID**

**MISSING INSULATION**

- MISSING INSULATION
- NO INSULATION BEHIND METER BOX
- INSULATION CUT BEHIND CAVITY TRAYS
- INSULATION AROUND CAVITY TRAY

**WHAT TO DO?**

- Install rigid insulation behind steel louvres, cavity trays, meter boxes and solrfan vents or any other elements bridging cavity
- Blown or injected insulation, ensure this reaches the whole wall with no gaps
- Adjust drill pattern for tight spots, cavity trays and inject below DPC

**GOOD PRACTICE**

Use preformed tray around complex junctions

Please print and use in your site office, for further information: www.zerocarbonhub.org

5. Cost Efficiency Handbook
6. Services Simplified
7. Builders’ Book - Timber Frames
THE FUTURE
ZCH
OVERHEATING PROJECT
An interesting time for new build homes....

EPBD Article 2, NZEB definition:
[...] ‘nearly zero-energy building’ means a building that has a very high energy performance [...]. The nearly zero or very low amount of energy required should be covered to a very significant extent by energy from renewable sources, including energy from renewable sources produced on-site or nearby.[...]

NZEB System Schematic
